from the Tuebingen strain. 1st strand cDNA was primed wi
a Not I - oligo(dT) primer, double-stranded cDNA was
cloned into the Not I and EcoRV sites of pExpress-1.
Library was size-selected for >1 kb fragments and
normalized. A non-normalized version of this library is
also available (NIH_ZGC 10). Library was constructed by

KS(+); Site_1: EcoRI; Site_2: Not1; This normalized library was constructed from 1 million independent clones. CDNA synthesis was initiated using an oligo(dT) primer, using methylated C in the first strand synthesis reaction. Following this first strand reaction, double-stranded cDNA was blunted, ligated to NotI adapters, digested with EcoRI, size-selected, and cloned into the NotI and EcoRI compatible sites of a custom modified MCS of the pBluescript (KS+) vector. The library was normalized in 2 rounds using conditions adapted from Soares et al., PNAS (1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6 (1966): 791, except that a significantly longer reannealing hybridization was used."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       110 GlyProProGluAlaPheThrThrSerValArgSerTyrLeuProAsnThrValThrAsp 129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA sequencing by: University Core DNA Services, University of calgary. Submitted sequence has been trimmed at both ends to remove the adaptor oligos containing the EcoRI sites; i.e. GAATTCGGACTA (beginning) and TAGTCCGAATTC (end) removed. Therefore, reported insert length is longer than actual EST sequence length. Insert Length: 359 Std Error: 10.00 Seq primer: T3.0r.T7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Department of Biochemistry and Molecular Biology University of Calgary 3330 Hospital Drive N.W., Calgary, Alberta, T2N Tel: 403 220 2888 Fax: 403 283 8727

        /clone lib="Bain Rancourt retinoic acid induced ES cell neural differentiation subtraction library"
/note="vector: pBluescript II SK+ (Stratagene); Site_1: EcoR1; Site_2: EcoR1; Library constructed by Dr. Gerard Bain (present address: Hoechst-ARIAD Genomic Center, ARIAD Pharmaceuticals Inc., 26 Landsdowne Street, Cambridge, Massachusetts, 02139-4234, U.S.A.). To isolate cDNAs corresponding to mRNAs which are upregulated during the neural differentiation of ES cells in vitro, the subtractive hybridization technique of Wang and Brown [1] was employed. Poly(A)+ RNA was prepared from both undifferentiated ES cells and from embryoid bodies which had head neural track for Asam in the absorbed for follows.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (Gibco). Aliquots of Doth CUNMAS were clysted with the restriction enzymes AluI and AluI plus Real. An adaptor oligo [1] containing an EcoRI site was ligated to the ends of the restricted CDNAs to provide primer binding sites and large amounts of each cDNA population were then produced by the polymerase chain reaction (PCR) as described [1]. Amplified cDNA from undifferentiated ES cells was biotinylated using Photoprobe biotin (Vector Laboratories) according to the manufacturer's protocol.

2.5 ug of amplified cDNA from 4-/3+ cells was mixed with 50 ug of biotinylated ES cell cDNA, denatured by boiling, and hybridized for 20 h. Double stranded cDNAs containing biotin were removed by streptavidin/phenol treatment as described [1]. The remaining subtracted cDNA was mixed with an additional 25 mg of biotinylated ES cell cDNA, denatured by boiling, and hybridized for 2 h. The streptavidin/phenol treatment was repeated and the remaining cDNA was amplified by PCR [Wang and Brown, 1991]. Two additional rounds of subtraction were repeated to pBS II SK+ (Stratagene) followed by transformation into E. coli DH5 cells. Individual colonies were picked and the corresponding plasmids were isolated either by an alkaline lysis miniprep procedure [2], or using the gardencer (University Core DNA Services, University of Calgary). 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rm. 308, Biomedical Polymers Research Bldg.,
was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Cold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Email: poustka@molgen.mpg.de
The library was characterised by oligonucleotide fingerprinting
(ONF) to reduce sequencing redundancy. According to the ONF
procedure, clones that display the same hybridisation matrix with a
battery of 200 8mer oligonucleotides are grouped into clusters. One
clone per ONF cluster is selected for sequencing. The size of each
cluster is an indicator of the frequency of a transcript in the
analysed library. The cluster size as well as the coordinates of
the other clones assigned to the same ONF cluster as the clone from
which the above EST is generated is available at the sea urchin
project web site at http://www.molgen.mpg.de/ag_seaurchin/.cDNA
clones and filters are distributed via the Resource Center/Primary
Database of the German Human Genome Project (http://www.rzpd.de)
